

LEGALEASE AI

Phase 7 - Project Development Phase

Project Development Documentation

Prepared for Project Submission

Python | FastAPI | Web Application

Field	Details
Project Name	LegalEase AI
Project Phase	Phase 7 - Project Development Phase
Project Type	AI-Assisted Legal Document Application
Technology	Python, FastAPI, Web Application

1. Project Overview

LegalEase AI is an AI-assisted legal document application developed to help users work with legal documents through a simple and user-friendly web interface.

The application provides an accessible platform for processing legal document-related information and interacting with the developed system. It combines a web-based user interface with a Python-based backend to provide the required application functionality.

2. Project Development

The LegalEase AI application was developed using a structured development approach.

Main Development Components

Component	Description
Frontend / User Interface	Interface through which users interact with the LegalEase AI application.
Backend	Developed using Python and FastAPI to handle application requests and backend processing.
API Layer	FastAPI provides the backend API endpoints required by the application.
Document Processing	Supports legal-document-related processing according to the implemented project functionality.

3. Technologies Used

Technology	Purpose
Python	Backend application development
FastAPI	Backend API development
HTML / CSS / JavaScript	Web interface
AI / NLP Components	Legal document-related processing
Git & GitHub	Source code management and project submission

4. Project Source Code

The complete LegalEase AI project source code is maintained in the project repository.

Source code includes:

- Backend source code
- Frontend / user interface files
- API implementation
- Configuration files
- Supporting project files
- Database-related files, if used
- Test files, if implemented

GitHub Repository: [Paste GitHub Repository URL Here]

5. Project Structure

The repository contains the files and folders used to run and maintain the application.

```
LegalEase AI/  
+-- Backend/  
|   +-- Application Source Code  
|   +-- API Files  
|   +-- Configuration Files  
+-- Frontend/  
|   +-- User Interface Files  
|   +-- Static / Supporting Files  
+-- requirements.txt  
+-- README.md  
+-- .env.example  
+-- Other Required Project Files
```

Note: folder names should match the actual LegalEase AI repository.

6. Dependencies

Python dependencies required by the backend are maintained in **requirements.txt** and installed with:

```
pip install -r requirements.txt
```

7. Environment Configuration

The application may require environment variables for configuration. The actual **.env** file must **NOT** be uploaded to GitHub when it contains sensitive information such as API keys, passwords, access tokens, database credentials, secret keys or private credentials.

A safe template is provided as **.env.example** with placeholder values only:

```
API_KEY=your_api_key_here  
DATABASE_URL=your_database_url_here
```

8. Application Setup

Step 1 - Clone the repository

```
git clone [GitHub Repository URL]
```

Step 2 - Open the project

```
cd LegalEase-AI
```

Step 3 - Install dependencies

```
pip install -r requirements.txt
```

Step 4 - Configure environment variables

Create the required .env file locally. Do not upload the actual .env file containing secrets to GitHub.

Step 5 - Run the application

```
uvicorn main:app --reload
```

Note: change the command to match the actual entry-point file of the project.

9. API Documentation

The backend is developed using FastAPI. While the application is running, interactive API documentation is available at:

```
/docs  
/redoc
```

10. Database / Data Files

If the implementation uses a database, the related files (schema, migrations, seed data, configuration, required data files) are maintained in the repository. If no database is used: **Not Applicable**.

11. Testing

The developed application was tested to verify that the implemented functionality works as expected.

Testing areas:

- [] Application startup
- [] User interface functionality
- [] Backend API functionality
- [] Document processing functionality
- [] Input validation
- [] Error handling
- [] Integration between frontend and backend

Test Result: [Add actual testing result after final verification]

12. Deployment

Deployed Application URL: [Paste Deployment URL Here]

Deployment Status: Not yet deployed / Deployment in progress

13. Docker / Container Configuration

If Docker is used, Dockerfile and docker-compose.yml are included in the repository. If not: **Not Applicable.**

14. Demo / Walkthrough

Demo Video: [Paste Demo Video Link Here] / Not Applicable

15. APK / Executable

APK / Executable: [Add file or link if applicable] / Not Applicable

16. GitHub Submission Checklist

- ☐ Complete source code uploaded
- ☐ Backend files uploaded
- ☐ Frontend files uploaded
- ☐ requirements.txt uploaded
- ☐ README.md uploaded
- ☐ Required configuration files uploaded
- ☐ Database files uploaded, if applicable
- ☐ .env containing secrets NOT uploaded
- ☐ API keys NOT uploaded
- ☐ Passwords NOT uploaded
- ☐ Access tokens NOT uploaded
- ☐ .env.example included with placeholder values
- ☐ Temporary / unnecessary files removed
- ☐ GitHub repository checked
- ☐ Application tested successfully
- ☐ Deployment URL added, if applicable
- ☐ Demo link added, if required

17. Final Project Status

Item	Status
Project	LegalEase AI
Phase	Phase 7 - Project Development Phase
Development Status	Completed / Final Verification
Source Code	Maintained in GitHub repository
Backend	Python + FastAPI
Documentation	README and required project documentation
Dependencies	requirements.txt
Security	Sensitive credentials excluded from the public repository
Deployment	[Add status / URL]
Demo	[Add link if required]

18. Conclusion

The LegalEase AI project has been developed as an AI-assisted legal document application with a web-based interface and a Python FastAPI backend.

The project repository contains the source code, dependencies, configuration information and documentation needed to understand and run the application. All sensitive credentials and secret configuration values are kept outside the public GitHub repository.

The final submission should be verified to ensure that the source code, documentation, dependencies, testing information and applicable deployment or demonstration resources are available.
