

Project Proposal (Proposed Solution)

Date	29 September 2026
Team ID	SWTID-2026-7995
Project Title	LegalEase AI
Maximum Marks	5 Marks

LegalEase AI is an AI-assisted web application designed to simplify the process of preparing basic legal documents. The solution guides the user from selecting a document type and entering details or terms to generating, reviewing, editing, and exporting the document.

Project Overview	
Objective	To provide a simple guided workflow for generating basic legal documents from user-provided details or terms, reducing manual drafting effort.
Scope	The implemented scope covers document type selection, user input of details/terms, AI-assisted document generation, generated-document review/editing, and TXT/DOCX/PDF export.
Problem Statement	
Description	Users without a legal background may find legal wording difficult to prepare or understand. Creating a document manually can also require repeated editing, formatting, and checking.
Impact	A guided document-generation workflow can reduce manual effort and make the preparation process easier to follow. The generated content should still be reviewed by the user before use.
Proposed Solution	
Approach	LegalEase AI uses Streamlit for the user interface, FastAPI for backend request handling, and Gemini for AI-assisted generation. The user selects a document type, provides the required information, generates the document, reviews or edits it, and exports it.
Key Features	• Document type selection • Details / terms input • AI-assisted document generation using Gemini • Generated document review and editing • TXT, DOCX and PDF export
Expected Outcome	A usable web-based workflow that helps users create a structured legal document draft from their supplied information and save the result in common document formats.

Important: LegalEase AI generates a document draft based on the information supplied by the user. The user should review the generated document and seek appropriate professional legal advice when required.
