

LegalEase AI: AI-Powered Legal Document Generator

Project Description:

LegalEase AI is an AI-assisted legal document application designed to help users generate draft legal documents from the information they provide. The application allows users to select a document type, enter relevant parties, terms and effective date, and generate a structured legal-document draft for review and editing.

The application uses a web-based interface with a Python/FastAPI backend and AI-assisted document generation. Generated documents can be reviewed and edited before being exported in TXT, DOCX, or PDF format. The system is intended to simplify the initial drafting process and does not replace qualified legal advice or jurisdiction-specific legal review.

Scenarios

Scenario 1: A user selects a Rental Agreement and enters the landlord and tenant details, monthly rent, security deposit, rental period, and effective date. LegalEase AI generates a structured rental-agreement draft that the user can review and edit.

Scenario 2: A user selects an Employment Contract and provides employer and employee details, job role, terms of employment, and effective date. The system generates an employment-contract draft for review before export.

Scenario 3: A user reviews the generated legal document, makes necessary edits, and exports the final draft as a TXT, DOCX, or PDF file for further use and jurisdiction-specific legal review.
