

Solution Requirements

Date	29 September 2026
Team ID	SWTID-2026-7995
Project Name	LegalEase AI
Maximum Marks	4 Marks

Define Functional and Non-Functional Requirements:

Create a list of requirements to define exactly what LegalEase AI will do and how well it will perform. Functional requirements describe system behaviours and features, while non-functional requirements describe quality criteria.

Step 1: Functional Requirements (FR)

S.No	Requirement Category	Requirement Description	Priority (High/Medium/Low)
1	Authentication	The current application does not implement user login or account authentication. Users access the application directly.	Low
2	Authorization levels	The current application does not implement separate user roles or permission levels. The available workflow is the same for the user.	Low
3	External interfaces	Streamlit provides the user interface. FastAPI provides the backend API. Gemini is used through the backend for document generation.	High
4	Document type selection	The user can select the required legal document type before entering the required details or terms.	High
5	Details / terms input	The system accepts the information and terms entered by the user for generating the selected document.	High
6	Document generation	The backend sends the required information to Gemini and returns the generated legal document content.	High
7	Review and editing	The generated document is displayed so the user can review the content and make required edits before export.	High
8	Document export	The user can export the generated document in TXT, DOCX, or PDF format.	High

Step 2: Non-Functional Requirements (NFR)

S.No	Requirement Category	Requirement Description	Priority
1	Usability	The interface should be simple and easy to understand so that a user can select a document type, enter details, generate the document and export it without unnecessary steps.	High
2	Performance	The application should process user input and return the generated document within a reasonable time depending on backend and AI response time.	High
3	Reliability	The system should handle valid user inputs consistently and show an appropriate message when generation or export cannot be completed.	High
4	Security	User-provided information and API credentials should be handled securely. API keys should not be exposed in the user interface or source code.	High
5	Maintainability	The frontend, backend and AI generation logic should remain separated so that individual components can be updated more easily.	Medium
6	Compatibility	The application should be usable through a modern web browser on commonly used desktop or mobile devices.	Medium
